

SKF spherical roller bearings – setting a new standard for performance and reliability

Contents

Made by SKF® stands for excellence. It symbolises our consistent endeavour to achieve total quality in everything we do. For those who use our products, "Made by SKF" implies three main benefits.

Reliability – thanks to modern, efficient products, based on our worldwide application know-how, optimised materials, forward-looking designs and the most advanced production techniques.

Cost effectiveness – resulting from the favourable ratio between our product quality plus service facilities, and the purchase price of the product.

Market lead – which you can achieve by taking advantage of our products and services. Increased operating time and reduced down-time, as well as improved output and product quality are the key to a successful partnership.

Economical and robust

Why spherical roller bearings?

Spherical roller bearings offer an attractive combination of design features, which are making them irreplaceable in many demanding applications.

- **Self-aligning**

Spherical roller bearings allow misalignment between shaft and housing without increase of friction and without reduction of bearing life.

- **Very high load carrying capacity**

Optimum layout inside available cross-section provides maximum radial and axial load carrying capacity.

- **Robust**

Insensitive to misalignment caused by shaft or housing deflection due to heavy load.

- **Easily fitted for loads in all directions**

The bearings are non-separable and ready to install using a number of mounting methods.

- **Easy bearing application**

The favourable design characteristics and mounting enable for a more efficient and compact machine design.

Spherical roller bearings with integral seals offer additional benefits.

- **Protection against contamination**

Sealed spherical roller bearings are especially suited for bearing positions where, because of limited space or for cost reasons, effective external seals cannot be provided.

- **Grease retention**

Contact seals on both sides of the bearing retain the factory filled grease where it is required: inside the bearing.

- **Minimum maintenance requirements**

Under normal operating conditions, sealed spherical roller bearings are maintenance free, keeping service costs and grease consumption low.

1 Product information

Customer benefits

Why SKF spherical roller bearings?

SKF bearings are developed for customer satisfaction. The best confirmation of the total quality of SKF spherical roller bearings is their success on the market. There are twice as many SKF spherical roller bearings in service as those of any other bearing manufacturer.

This is not just by chance: SKF spherical roller bearings are well-proven in the field and undergo continuous development to provide improved performance. The most recent example has been the introduction of the Explorer bearings, which opened up new application horizons, and the sealed bearings in standard and Explorer versions.

2 Recommendations

Page 18

The use of SKF spherical roller bearings implies several benefits.

Application efficiencies

SKF spherical roller bearings have a very high load carrying capacity in the radial and axial directions. Bearing applications become increasingly cost effective due to

- long service life and
- compact arrangements.

Reduced operating costs

The optimised and robust internal design of the SKF spherical roller bearings minimises friction and heat, and by this, lubricant consumption. In service, this reduces costs due to

- less machine downtime,
- minimised maintenance requirements and
- high reliability.

3 Product data

Page 32

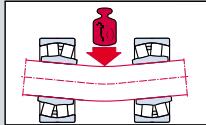

Seals integration

Under normal operating conditions, sealed SKF spherical roller bearings are greased for life and make external seals unnecessary, creating additional benefits:

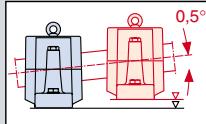

- simplified bearing arrangements;
- no relubrication.

Standard solution

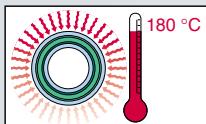

Many bearing applications previously fitted with expensive special bearings can now be equipped with SKF spherical roller bearings. Because of the global availability of SKF spherical roller bearings, spare parts are much easier to get.

Rugged

Tolerant to alignment errors

Resistant to elevated temperatures

1 Product information

Customer benefits

Customer satisfaction

Equipment owners will be impressed by the low operating costs in combination with high reliability contributed by SKF spherical roller bearings. Not only are costs reduced, but with sealed versions environmental resources are spared.

SKF bearings:
always the best choice, when robustness and reliability matter

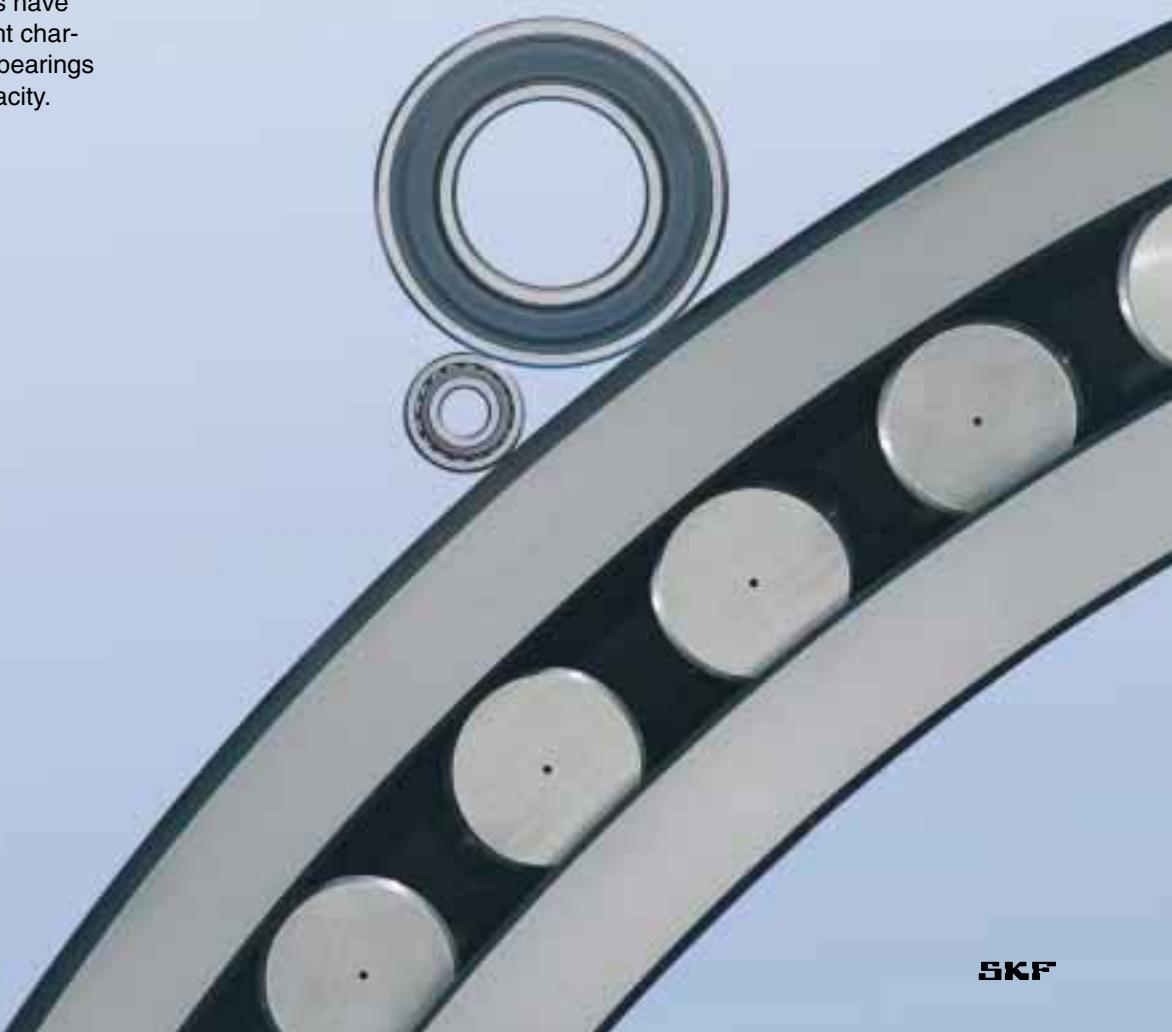

Bearing series

A complete bearing range

The range of open and sealed SKF spherical roller bearings covers all series currently in demand. Taking availability into account, this constitutes the most complete range on the market.

Narrow low-section bearings have better speed, space and weight characteristics. Wide high-section bearings have higher load carrying capacity.

1 Product information

Product range

SKF spherical roller bearings without seals

The open bearings are available in sizes from 20 to 1 800 mm bore diameter and with cylindrical or tapered bore to suit all types of mounting methods. To facilitate efficient lubrication, most bearings are provided with an annular groove and three lubrication holes in the outer ring.

The bearings are available in a wide range of series designed to satisfy the following selection criteria:

- load carrying capacity;
- combination of radial and axial loads;
- rotational speed;
- space in the application.

2 Recommendations

Page 18

3 Product data

Page 32

Sealed SKF spherical roller bearings

The SKF range of sealed spherical roller bearings comprises bearings with cylindrical bore for shaft diameters of 35 to 220 mm and bearings with tapered bore for shaft diameters of 40 to 90 mm in the seven most frequently used bearing series. Further sizes can be produced to special order.

The seals have been specially developed for spherical roller bearings and effectively prevent contamination from entering the rolling contact area. This is not only true in operation, but also during bearing installation, resulting in long service life.

SKF spherical roller bearings – leading in design

Standard bearings: a unique combination of design features

All SKF spherical roller bearings have features in common which are unique in the market:

- symmetrical rollers
- special roller profile
- self-guiding rollers – an SKF patent
- floating guide ring between the two rows of rollers
- bearing components dimensionally stabilised for high temperatures
- metallic cages

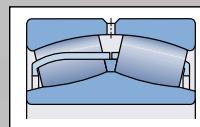

To facilitate efficient bearing lubrication SKF standard spherical roller bearings are provided with three lubrication holes in the outer ring, mostly in combination with an annular groove. Depending on size and series, standard SKF spherical roller bearings are basically made in three different designs:

- E design
- CC design
- CA design

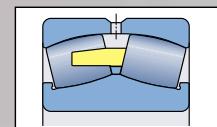

E design

The bearings of this design have symmetrical rollers, two hardened window-type steel cages centred on the inner ring, a flangeless inner ring and a floating guide ring between the two roller rows.

CC design

With symmetrical rollers, two window-type steel cages which are inner ring centred via a floating guide ring between the two roller rows.

CA design

With symmetrical rollers. The inner ring centred guide ring centres the one piece, double pronged machined cage of brass or steel. The inner ring has retaining flanges.

Durable cage design

Steel and brass cages are strong as well as tolerant to high temperatures and all lubricants. Small and medium size bearings have window-type steel cages, larger sizes have machined double pronged brass or steel cages.

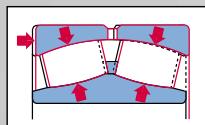

E design

CC design

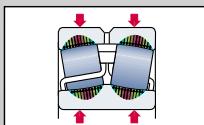

1 Product information

Leading in design

Very high load carrying capacity

The symmetrical rollers self-adjust, providing an even load distribution along the roller length. This gives very high load carrying capacity under all load combinations.

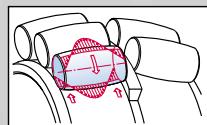

No edge stresses

The special roller profile minimises the risk of edge stresses.

2 Recommendations

Page 18

Reduced friction and minimum heat generation

Self-guiding rollers – an SKF patent – mean reduced friction and minimum heat generation.

Excellent performance at high temperatures

High-strength, dimensionally stable bearing rings minimise the risk of ring breakage and also allow good performance at high temperatures.

3 Product data

Page 32

Setting new standards: the SKF Explorer

1

The unique SKF spherical roller bearing designs were the starting points for further development of materials and manufacturing processes. The Explorer spherical roller bearings are the result of very skilled and intensive fine tuning processes, which, taken all together constitute a new performance level for spherical roller bearings.

- **Steel**

New, ultra-clean for longer life at higher loads.

- **Heat treatment**

New procedures significantly improve wear resistance.

- **Manufacturing**

Refined processes allow the production of smoother running bearings with improved lubrication.

- **Internal geometry**

A fine-tuned micro-geometry of the rolling contacts gives better stress distribution.

Explorer bearings give more performance for the same size as explained in more detail from **page 12** onwards.

CA design

1 Product information

Sealed bearings

Sealed SKF spherical roller bearings – for demanding environments

Sealed SKF spherical roller bearings are designed to fulfil high demands on sealing efficiency and operational reliability under difficult environmental conditions. The seals were developed using computer simulation, making full usage of the vast expertise within the SKF Group. They have been extensively tested both in the laboratory and in the field and have proved their reliable performance and efficiency.

2 Recommendations

Page 18

SKF sealed spherical roller bearings include double-lip, sheet steel reinforced seals made of

- nitrile rubber (NBR)
- hydrogenated nitrile rubber (HNBR)
- fluoro rubber (FPM)

and a grease fill which is appropriate to the operating conditions.

This forms a ready-to-mount and lubricated-for-life bearing with long service life and normally the same space requirements as a standard open bearing. The advantages include a simplification of the bearing arrangement, as well as the option of down-

3 Product data

Page 32

sizing. Facilities for relubrication are normally not required, and there are no more costs for purchasing, applying and disposing of bearing greases.

Temperature limits

Sealed SKF spherical roller bearings are suitable for normal operating temperatures up to 110 °C (230 °F). Bearings for higher operating temperatures can be produced upon request. In these cases, the grease and seal material must be chosen accordingly. Other operating conditions such as the speed may need to be considered as well. Please contact the SKF application engineering service for further advice.

1 Product information

Sealed bearings

Contamination resistance

Due to the efficiency of the integral seals, additional external seals are normally not required. Generally compact bearing arrangements can be produced in most cases. However, if the environmental conditions are harsh, external seals should be employed (→ fig. 1).

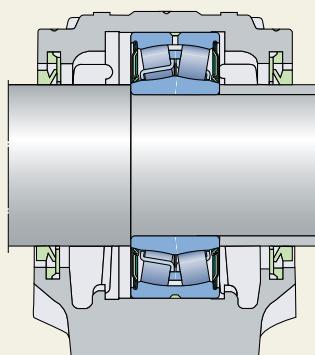

2 Recommendations

Page 18

3 Product data

Page 32

Fig 1

A sealed spherical roller bearing in an SNL plummer block housing

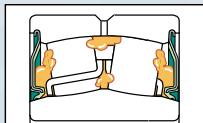

Warning for fluoro rubber (FPM) seals

FPM is very stable and harmless in normal operating conditions – up to 200 °C (392 °F). However, if exposed to extreme temperatures above 300 °C (572 °F), e.g. fire or the flame of a cutting torch, fluoro rubber emits dangerous toxic vapours. Once overheated the fluoro rubber will remain dangerous to handle even when cooled. Please contact SKF for complete safety instructions. See also SKF catalog 4006 "CR seals" for further information.

1

Rule of thumb

Sealed bearings do not need relubrication when the temperatures do not exceed 70 °C (158 °F) and speed are not more than 50 % of the speed rating listed in the product tables. More precise information is given in the section "Lubrication and maintenance" on page 28.

Well lubricated

Bearings for normal operating temperatures and speeds are lubricated with the SKF lithium base grease LGEP 2 with excellent rust inhibiting properties.

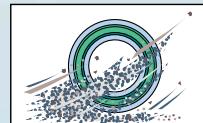

Well protected

The bearings have a sheet steel reinforced double-lip seal at each side. Seals can be made of nitrile rubber (NBR), hydrogenated nitrile rubber (HNBR) or fluoro rubber (FPM).

Solid contaminants excluded

Eliminate dirt in the bearing, which creates indentations in both raceways and rollers and causes early failure due to flaking. The best and simplest method to do this is to use SKF sealed spherical roller bearings. The seals offer protection for the bearing interior during handling and mounting.

Always reliable

The bearings are filled with a high-quality grease, which is particularly suitable for SKF spherical roller bearings. Integral seals contribute to the efficient lubrication by keeping the lubricant in position inside the bearing.

Moisture cannot enter

Adequate seals keep water out of the bearing, which otherwise would cause corrosion and considerable damage to the raceways, leading to noise and early failure. The improved seals are endorsed by the rust inhibiting properties of the lubricant.

SKF Explorer – the new performance class for spherical roller bearings

Having invented the spherical roller bearing some eighty years ago, SKF has been the leading manufacturer of these bearings ever since.

Now our specialists in all different disciplines have combined their experience and know-how into one large step forward in bearing technology. And we are proud of having made tomorrow's bearing technology available for our customers today. The Explorer bearings represents a significant breakthrough in performance. By studying the interrelationship between each bearing component, SKF scientists were able to maximize the effects of lubrication and minimize the effects of friction, wear, and contamination.

The Explorer design is the result of years of intensive research by an international team of SKF scientists and engineers. It incorporates a number of improvements including:

The new material

The new steel used in SKF Explorer bearings is extraordinarily clean and homogeneous. It forms a perfect structure which does not generate stress peaks under load.

The new heat treatment

Together with a refined heat treatment process, the new steel significantly improves the SKF Explorer bearings wear resistance. It does this while retaining the temperature resistance and toughness of the bearings.

The new manufacturing processes

Improved manufacturing processes has enabled the tightening of the tolerances for all essential bearing features. To achieve good bearing performance, the surface texture has been refined to maintain an optimum oil film between the contacting surfaces.

The new bearing knowledge

Sophisticated in-house software has enabled SKF design engineers to study internal bearing dynamics to an extent not possible previously. This led the way to design refinements, which, implemented in the Explorer bearings, allowed further optimisation of the rolling element/raceway contacts.

1 Product information**New performance class****The result: longer bearing life**

All these improvements contribute to a significant increase in bearing service life and reliability. This can best be shown through calculation using the SKF Life Method. The properties of SKF Explorer spherical roller bearings are taken into consideration by

- increased basic dynamic load ratings and
- an increased life adjustment factor a_{SKF} .

2 Recommendations

Page 18

Availability

The popular small and medium size spherical roller bearings in the series 213, 222, 223, 230, 231, 240 and 241 are available as Explorer bearings. The range is being extended in these bearings series as well as in other series.

In the product table, the Explorer bearing designations are printed in blue.

3 Product data

Page 32

Product designations

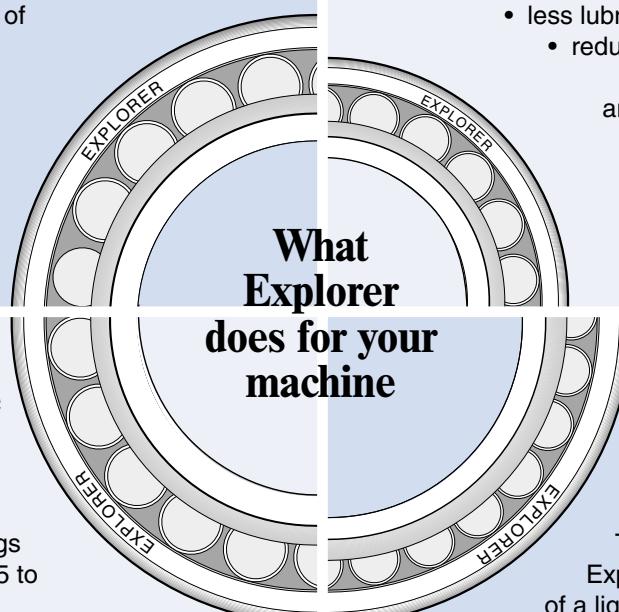

The Explorer bearings retain the designations of the earlier standard bearings, e.g. 22218 E or BS2-2210 C-2CS. However, each bearing and its box is marked with the name EXPLORER, so that there can be no confusion.

Existing machine

Switching to Explorer bearings give

- several times the service life previously achieved,
- more machine uptime,
- higher safety factor,
- an appreciable reduction of machine cycle cost

and, therefore, added value.

**Existing machine with increased power**

Same size Explorer bearings allow power increases of 15 to 25 % with

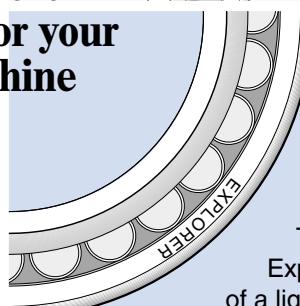

- same service life,
 - same machine uptime,
 - same machine design,
- and higher added value.

New machine with same power

Explorer makes it possible to use a smaller bearing size which allows

- more compact machines,
- higher speeds,
 - smoother and quieter running,
 - less lubricant usage,
 - reduced friction,

and will create added value.

**New machine with same or increased power**

The higher carrying capacity of Explorer bearings allows the use of a lighter series with same outside diameter and increased bore diameter, so that

- a stronger, or even hollow shaft can be used,
- the total design can be stiffer and also cheaper,
- system life is increased due to higher stiffness,

and machine cycle cost is significantly reduced.

Efficient in all industrial segments

Industrial segments

- Metallurgical
- Mining & construction
- Pulp & paper
- Fluid machinery
- Materials handling
- Industrial gearboxes
- Textile industry
- Railways

Requirements

- Long service life
- High load carrying capacity
- Compact arrangements
- Tolerant of misalignment
- Minimum maintenance
- Reduced operation costs
- No unplanned stoppages
- Environmental welfare
- High availability
- Technical support

Solution

Long service life, high reliability, limited maintenance and the ability to design compact arrangements have made SKF spherical roller bearings indispensable in many industries. In addition to the industries listed above SKF spherical roller bearings are also used in bridges, dam gates, electric motors, generators, plastic calenders, extruders, printing machines, robots and many other applications.

Because end users are recognizing that high quality bearings deliver an excellent return on investment, SKF spherical roller bearings are becoming the preferred choice in new applications.

Where maintenance can be a nightmare

To get to the top is always a challenge, particularly if the goal is the top of ski-lift masts in mid winter when it is 30 degrees below zero and the bearings have to be relubricated. If operational reliability is to be achieved, then it has to be done. Regular relubrication is a must if the bearings are to be kept from rusting because of condensation. In addition safety considerations call for regular inspections – a dangerous job high up in mountainous terrain and under difficult weather conditions.

The introduction of SKF sealed spherical roller bearings has made all the dif-

ference. It is now only necessary to perform maintenance once a season – before starting operation. The highly efficient seals reliably exclude condensation so that corrosion is no longer a problem. It has also been possible to simplify the arrangement, saving space and costs – as well as making handling and installation easier.

Downsizing – more than just size

A typical application for spherical roller bearings is the winch of a traversing industrial lift. In this application the load, bending and deformation all call for rugged bearings that can function properly even under misalignment.

Open spherical bearing arrangements provided good service, but were too bulky and complicated to be considered completely satisfactory.

As a result, the open bearings were replaced with SKF sealed spherical roller bearings eliminating the need for the external seals and covers.

This obviously saved space and also meant that the bearings could be positioned 40 % closer to the drum, thus reducing the stress on the journals. In fact, it was possible to reduce the journal diameter by 20 % and use smaller bearings.

The new compact bearing arrangement requires much less maintenance and there is no loss of load lifting capacity. The result has been a 50 % savings of the total cost of the original bearing arrangement.

Trouble-Free Operation

Page 18

Page 32

Trouble-Free Operation - the SKF concept for cost saving

The bearings in a machine can be compared to the heart of a human being. If the bearing comes to a standstill, so does the machine.

Just as a doctor listens to the heart of a patient, so it is possible to listen to the bearings in order to judge the condition of the machine. It is possible to determine whether the bearing is in danger of failing prematurely because of faulty mounting, poor lubrication or other causes.

If the bearings are neglected the result will be higher costs, unnecessary stoppages and, in the worst case, damage to other components of the machine. However, if the bearings are given the attention they deserve, not only will productivity be increased, but costs for maintenance, purchasing and storage will be reduced.

Why is SKF so certain of this? Because, SKF bearings, given ideal operating conditions, can live almost for ever.

1 Product information**Trouble-Free Operation**

All that is needed is a partnership with SKF for Trouble-Free Operation (TFO™). This includes everything you need to eliminate downtime from one reliable source:

- plant maintenance assessment
- reliability systems – local and via satellite
- predictive and preventive maintenance programs
- root cause failure analysis
- lubrication and filtration management
- equipment maintenance and monitoring – fans, pumps, gear boxes and spindles
- precision balancing
- precision alignment
- productivity management process
- applications-specific training
- technology upgrades
- repair services

There is no single TFO program from SKF, because it is defined in terms of a company's own particular needs and application challenges. Whatever the choice, it will be a win-win situation.

More information can be obtained from the nearest SKF office or authorised dealer.

SKF mounting and dismounting tools***Practical SKF seminars cover all there is to know about mounting and maintaining rolling bearings***

Selection of bearing size

Bearing life

The life-extending improvements embodied in SKF Explorer spherical roller bearings can best be understood using the SKF Life Method. This calculation method constitutes an extension of the fatigue life theory developed by Lundberg and Palmgren and is better able to predict bearing life. The Life Method was first presented as the SKF New Life Theory in the SKF General Catalogue 4000 in 1989. For roller bearings

$$L_{naa} = a_1 a_{SKF} L_{10}$$

or

$$L_{naa} = a_1 a_{SKF} \left(\frac{C}{P}\right)^{10/3}$$

If the speed is constant, it is often preferable to calculate the life expressed in operating hours using

$$L_{naah} = a_1 a_{SKF} \frac{1\,000\,000}{60 n} \left(\frac{C}{P}\right)^{10/3}$$

where

L_{naa} = the adjusted rating life according to the SKF Life Method, million revolutions

L_{naah} = the adjusted rating life according to the SKF Life Method, operating hours

L_{10} = basic rating life, million revolutions

a_1 = life adjustment factor for reliability (\rightarrow Table 1)

a_{SKF} = life adjustment factor based on SKF Life Method (\rightarrow Diagram 1)

C = basic dynamic load rating, kN

P = equivalent dynamic bearing load, kN

n = rotational speed, r/min

a_{SKF} factor

The a_{SKF} factor represents a very complex relationship between various influencing factors including contamination and lubrication. Lubrication conditions are expressed by the viscosity ratio κ . Values of a_{SKF} can be obtained from **Diagram 1** for different values of η_c (P_u/P) and κ .

For standard spherical roller bearings, the values in black on the x axis should be used and for Explorer bearings the values in blue on the x axis. In fact, for Explorer spherical roller bearings it has been found appropriate to multiply η_c (P_u/P) by 1,4 as an expression of the life extending refinements of these bearings, and the blue values correspond to this.

Diagram 1 has been drawn up for a safety factor commonly used in fatigue life considerations and is valid for lubricants without EP additives. If a lubricant containing such additives is used, reference should be made to the SKF General Catalogue or the SKF Interactive Engineering Catalogue on CD-ROM or the Internet (www.skf.com).

Equivalent dynamic bearing load

The equivalent dynamic bearing load for spherical roller bearings can be obtained from

$$\begin{aligned} P &= F_r + Y_1 F_a && \text{when } F_a/F_r \leq e \\ P &= 0,67 F_r + Y_2 F_a && \text{when } F_a/F_r > e \end{aligned}$$

where

P = equivalent dynamic bearing load, kN

F_r = actual radial bearing load, kN

F_a = actual axial bearing load, kN

Y_1, Y_2 = axial load factors for the bearings

e = calculation factor

Appropriate values of the factors e , Y_1 and Y_2 will be found in the bearing tables for each individual bearing.

Life adjustment factor a_1

Table 1

| Reliability % | Factor a_1 |
|---------------|--------------|
| 90 | 1 |
| 95 | 0,62 |
| 96 | 0,53 |
| 97 | 0,44 |
| 98 | 0,33 |
| 99 | 0,21 |

1 Product information

Page 3

Standard and Explorer - a comparison

The performance enhancements incorporated into the SKF Explorer spherical roller bearings can best be demonstrated by a life calculation comparison for the bearing 22218 E in its earlier standard and its new Explorer version.

For the same operating conditions the life of

- the previous standard 22218 E with
 - a basic dynamic load rating $C = 282 \text{ kN}$, and
 - a fatigue load limit $P_u = 39 \text{ kN}$, and
- the Explorer bearing 22218 E with
 - a basic dynamic load rating $C = 325 \text{ kN}$, and
 - a fatigue load limit $P_u = 39 \text{ kN}$

are calculated.

The operating conditions are:

- equivalent dynamic bearing load $P = 28,2 \text{ kN}$
- viscosity ratio $\kappa = 2$
- contamination factor $\eta_c = 0,4$.

The lives of the two bearings are then calculated.

Earlier standard bearing

For $\eta_c (P_u/P) = 0,4 \times 39/28,2 = 0,55$ using the black values on the x axis in Diagram 1 and $\kappa = 2$

$$a_{\text{SKF}} = 3,7$$

so that the life becomes

$$L_{10aa} = a_{\text{SKF}} (C/P)^{10/3} = 3,7 \times (282/28,2)^{10/3}$$

$$L_{10aa} = 7\,970 \text{ million revolutions.}$$

2 Recommendations

Bearing size

Explorer bearing

For $\eta_c (P_u/P) = 0,4 \times 39/28,2 = 0,55$ using the blue values on the x axis in Diagram 1 and $\kappa = 2$

$$a_{\text{SKF}} = 7,1$$

so that the life becomes

$$L_{10aa} = a_{\text{SKF}} (C/P)^{10/3} = 7,1 \times (325/28,2)^{10/3}$$

$$L_{10aa} = 24\,500 \text{ million revolutions.}$$

3 Product data

Page 32

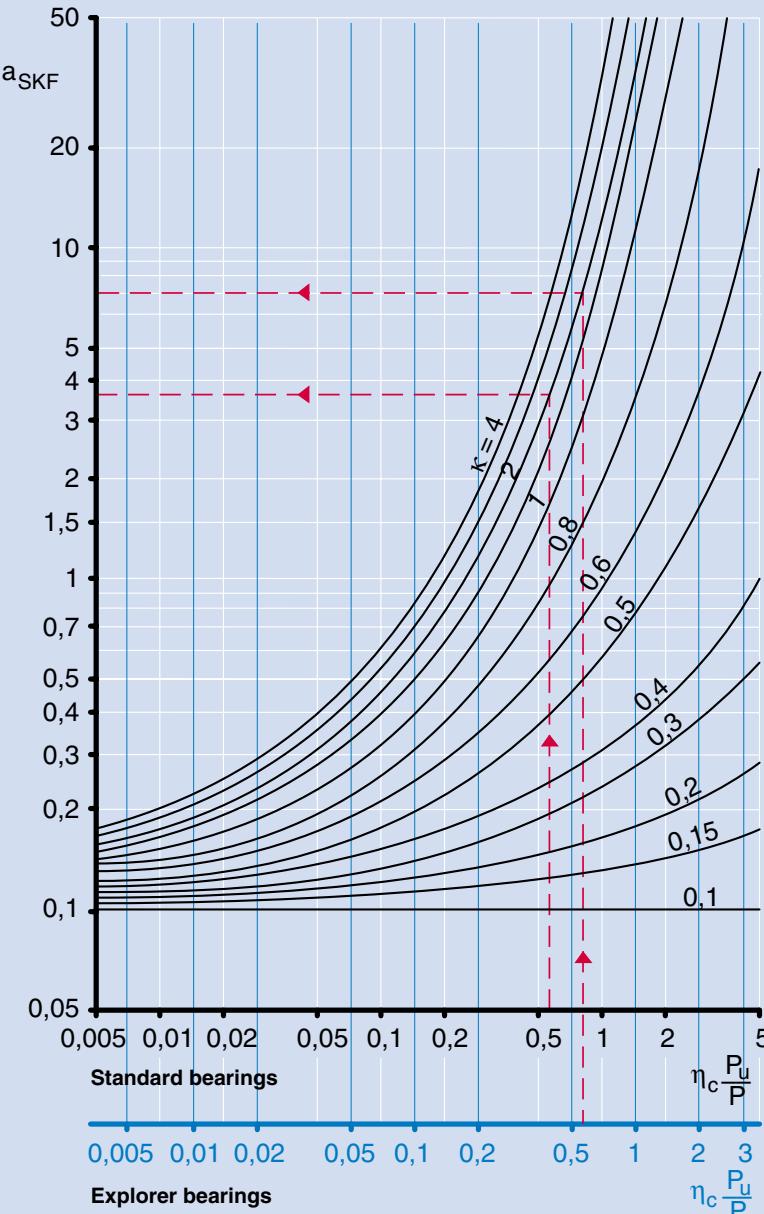

In this case, the Explorer bearing has a life compared with that of the previous standard bearing, which is $24\,500/7\,970 = 3,07$ or just over three times longer.

2

Factor a_{SKF} for spherical roller bearings

Diagram 1

If $\kappa > 4$, use $\kappa = 4$ curve
As the value of $\eta_c (P_u/P)$ tends to zero, a_{SKF} tends to 0,1 for all values of κ

1 Product information

Page 3

Minimum load

In order to provide optimum performance, spherical roller bearings must always be subjected to a given minimum load, especially if they operate at high speeds or are subjected to high accelerations or rapid changes in the direction of load. Under such conditions the inertia forces of the rollers and cage, and the friction in the lubricant, can have a detrimental influence on rolling conditions in the bearing and may cause damage due to sliding movements between the rollers and raceways.

The requisite minimum load to be applied to SKF Explorer spherical roller bearings can be estimated from

$$F_{rm} = 0,017 C - Y_0 F_a$$

and for standard spherical roller bearings from

$$F_{rm} = 0,02 C - Y_0 F_a$$

where

F_{rm} = minimum radial load, kN

C = basic dynamic load rating, kN

F_a = actual axial bearing load, kN

Y_0 = axial load factor of the bearing

The values for C and Y_0 will be found in the bearing tables for each individual bearing.

When starting up at low temperatures or when the lubricant is highly viscous, even greater loads may be required. The weights of the components supported by the bearing, together with the external forces, often exceed the requisite minimum load. If this is not the case, the bearing must be subjected to an additional radial load. It is advisable to contact SKF when problems with minimum load occur.

**Guideline values
for the static
safety factor s_0**

2 Recommendations

Bearing size

Required static load rating

The requisite basic load rating C_0 can be determined from

$$C_0 = s_0 P_0$$

where

C_0 = static load rating, kN

s_0 = static safety factor

P_0 = equivalent static bearing load, kN

Guideline values based on experience are given in **Table 2** for the static safety factor s_0 for various types of operation and requirements regarding smooth running.

The equivalent static bearing load for spherical roller bearings can be obtained from

$$P_0 = F_r + Y_0 F_a$$

where

P_0 = equivalent static bearing load, kN

F_r = actual radial bearing load, kN

F_a = actual axial bearing load, kN

Y_0 = axial load factor of the bearing

The appropriate value of the factor Y_0 will be found in the bearing tables for each individual bearing.

3 Product data

Page 32

Are you still doing these calculations by hand?

The CD-ROM "SKF Interactive Engineering Catalogue" includes all the equations mentioned in this brochure and the underlying software enables them to be calculated at the click of a mouse. Visit our site on the Internet "www.skf.com"

Application of bearings

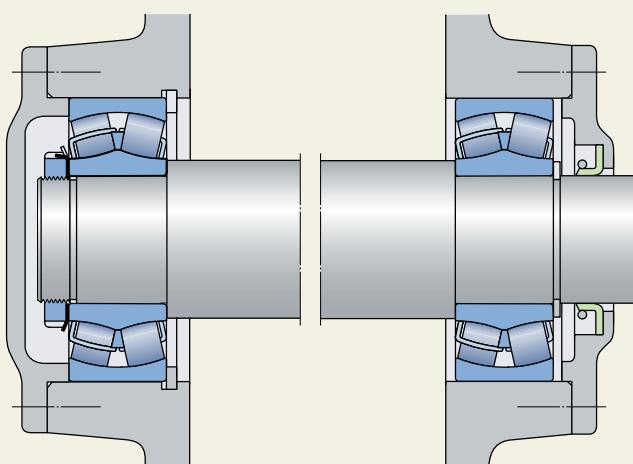

Conventional bearing arrangements

Conventional self-aligning bearing arrangements using two spherical roller bearings (→ fig 1) – one applied as a locating, the other as a non-locating bearing – are the basis of many industrial bearing arrangements. This is a simple robust arrangement capable of withstanding high radial as well as thrust loads, whilst easily accommodating misalignments.

The non-locating bearing must be able to slide axially, usually inside the housing, to accommodate shaft expansion or contraction. To achieve this movement, one of the bearing rings must be mounted with a loose fit and axial space provided for movement.

Under certain loading conditions, however, this bearing arrangement may not be suitable. The ring with a loose fit can creep and damage the housing. It can also result in accelerated wear and increased vibration, additional maintenance and repair costs. It also means that the shaft is supported less rigidly in the radial direction. In these situations, SKF recommends a new self-aligning system.

Fig 1

Conventional spherical roller bearing arrangement with locating (left) and non-locating bearing (right)

1 Product information

Page 3

The new self-aligning bearing system

The new self-aligning bearing system consists of a spherical roller bearing as the locating and a CARB® toroidal roller bearing as the non-locating bearing (→ fig 2).

This bearing system accommodates misalignment as well as axial movement without generating additional axial forces caused by the friction between the outer ring and housing. Due to the ideal co-operation of both bearings the real load situation is always as predicted.

The advantages of spherical roller bearings and CARB bearings are fully utilised in this bearing system, allowing the performance expected and needed by designers today.

The new self-aligning system enhances reliability and performance. Producers as well as users of machines have clearly reduced costs due to simpler design and increased productivity.

More information will be found in the SKF brochure 4417 "Self-aligning bearing systems".

Application advice

Radial location of bearings

If the load carrying ability of a bearing is to be fully utilised, its rings must be evenly supported around the circumference and across the whole width of the raceway. This support must be firm and even and can be provided by a cylindrical or tapered seating.

Sufficient support, as well as good radial location of the bearing, generally requires a tight fit between the bearing rings and the surrounding components. However, if easy mounting and dismounting is required, or for the one ring of non-locating bearings, a tight fit cannot be applied.

Further information on selection of fits and accuracy of the bearings seatings will be found in the SKF General Catalogue or CD-ROM "SKF Interactive Engineering Catalogue".

3 Product data

Page 32

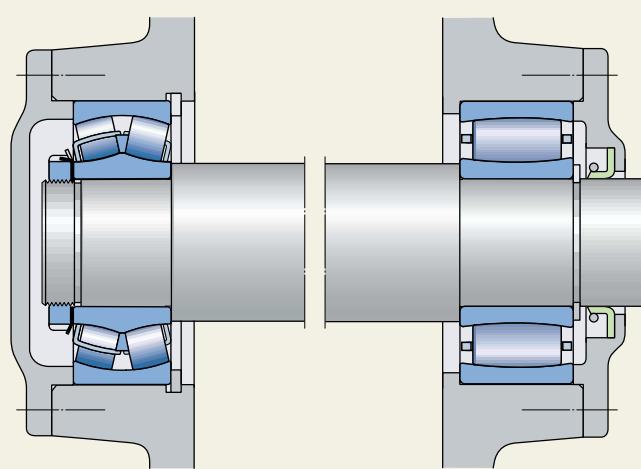

Fig 2

Self-aligning bearing system using a CARB bearing as the non-locating bearing

1 Product information

Page 3

Axial location of bearings

An interference fit alone is generally inadequate for the axial location of a spherical roller bearing ring. As a rule, some suitable means of axially securing the ring is needed. Both rings of a locating bearing should be axially secured at both sides. For non-locating bearings, on the other hand, it is sufficient if the ring having the tighter fit – usually the inner ring – is axially secured; the other ring must be free to move axially with respect to its seating (→ fig 1 on page 21).

Bearing rings having an interference fit are generally mounted so that the ring abuts a shoulder on the shaft or in the housing at one side. At the opposite side, inner rings are normally secured by a snap ring, shaft nut or an end plate attached to the shaft end. Outer rings are usually retained by the housing end cover (→ fig 1 on page 21).

An intermediate ring between the bearing and lock washer (of the nut) protects the seal

2 Recommendations

Application advice

The dimensions of the shaft and housing shoulders adjacent to the bearing must provide sufficient support for the bearing rings, without contact between the rotating parts of the bearing and a stationary component. To ensure this, appropriate abutment dimensions are quoted for each individual bearing listed in the product tables.

When using a shaft nut to locate a sealed bearing, insert an intermediate ring between the bearing and the locking washer and, probably, to extend the threaded portion of the shaft accordingly (→ fig 3).

Spherical roller bearing of CAK design on a tapered journal with oil supply ducts and grooves

3 Product data

Page 32

Design of associated components

For arrangements with large spherical roller bearings it is often necessary to make design provisions to enable the bearings to be mounted or dismounted easily. For example, withdrawal tools can be applied to dismount bearings, if appropriate slots are machined in the shaft and housing shoulders, or if threaded holes are provided in the housing shoulders.

If the oil injection method is to be used to mount and dismount bearings on tapered journals (→ fig 4) or to dismount bearings from cylindrical seatings (→ fig 5), it is necessary to provide oil supply ducts in the journal and grooves in the seating. Recommendations are given in the SKF publication 4100 "SKF Bearing Maintenance Handbook" or CD-ROM "SKF Interactive Engineering Catalogue".

Fig 3

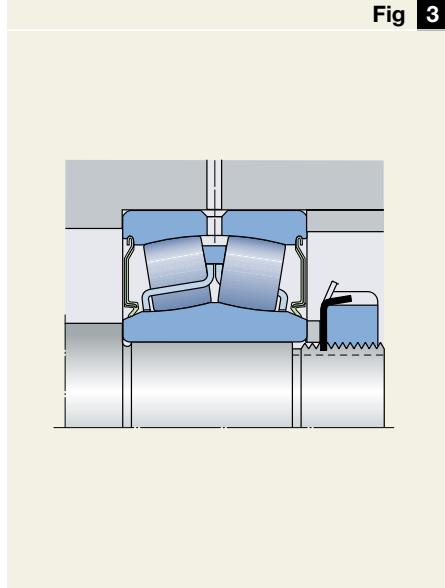

Fig 4

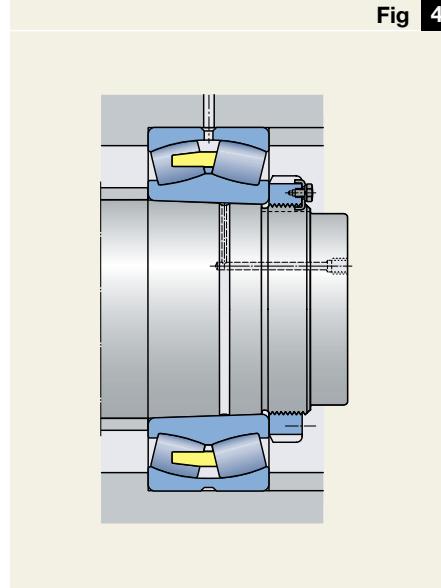

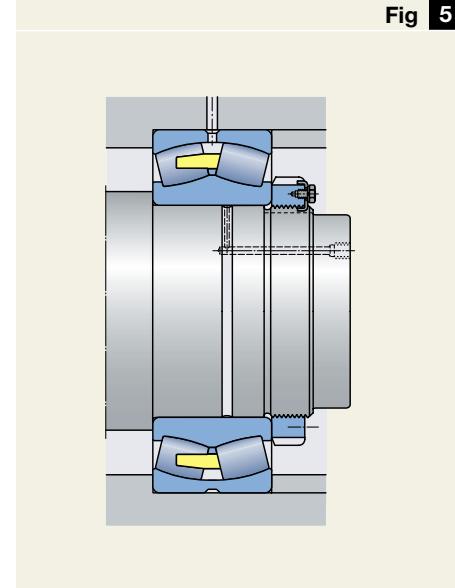

Fig 5

Mounting and dismounting

Bearing storage

Before leaving the factory, SKF spherical roller bearings are treated with a corrosion inhibitor. They can be stored in their unopened original packages for up to five years (three years for sealed bearings), provided the relative humidity in the store does not exceed 60 % (→ fig 1).

To avoid the risk of contamination and corrosion, the original packages should not be opened until immediately before mounting the bearing.

Mounting

Skill and cleanliness are essential when mounting bearings, to make sure that they perform satisfactorily and attain their full potential. Above all, the correct method of mounting should be chosen and suitable tools used. This is particularly important, where sealed SKF spherical roller bearings are concerned, since misalignments of the inner ring relative to the outer ring in excess of 0,5° may damage the seals. For optimum results in mounting and dismounting bearings, SKF offers a full range of tools and equipment. Please refer to the "Related SKF products" section on page 58.

Bearings with cylindrical bore

When mounting bearings with cylindrical bore, the ring with the tighter fit is normally mounted first.

The force required to mount a bearing increases according to the bearing size. Therefore, it is not always possible to press large bearings onto a cylindrical shaft or into a housing in the cold state. In this case, either the inner ring or the housing should be expanded by heating before mounting.

To mount with an interference fit on a shaft the bearing should be heated to some 80 to 90 °C (180 to 200 °F) above the temperature of the shaft. Please remember that sealed bearings should never be heated to more than 110 °C (230 °F).

The use of an SKF induction heater has been found very advantageous (→ fig 2). It heats the bearing rapidly, and a built-in thermostat prevents bearing damage caused by overheating. Non-metallic components such as seals remain cold, as does the heater itself.

Mounting bearings by cooling the shaft or the bearing is not recommended, as the very low temperatures required inevitably cause condensation, thus creating a risk of corrosion.

Correct storage of bearings

Page 3

Bearings with tapered bore

Bearings with tapered bore are always mounted with an interference fit on the shaft. They can be mounted on adapter or withdrawal sleeves or directly on to tapered journals.

When dimensioning a tapered journal, the distance between the centre of the bearing in its final mounted position and a reference face on the shaft should be used as a basis (→ fig 3). When the dimension B_a has been established, the dimensioning of the journal should be continued as described in SKF catalogue 4003 "Large bearings".

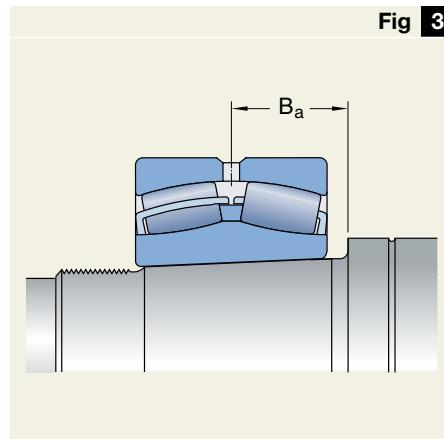

Spherical roller bearings up to 200 mm bore diameter may be driven up on to a tapered journal or a withdrawal sleeve using a shaft nut and on to an adapter sleeve using the sleeve nut and a spanner (→ fig 4).

The application of the high drive-up forces required by larger bearings can be facilitated using the oil injection method (→ fig 5). This necessitates the provision of oil supply ducts in the journals and oil distribution grooves in the seating. Further reduction of the mounting effort can be achieved by using the oil injection method in combination with an SKF hydraulic nut.

For bearings which are to be hot mounted, the final axial position on the seating has to be predetermined by means of, for instance, a tailor-made spacer ring (→ fig 6). When cold, the bearing will obtain its correct interference fit.

1 Product information

Page 3

The reduction in radial internal clearance of open bearings or the axial displacement of the inner ring on its tapered seating is used as a measure of the degree of interference (\rightarrow fig 7).

To effectively mount sealed bearings with a tapered bore, it is only possible to use the drive-up distance as a measure, and the "SKF drive-up method" is recommended. It allows the starting position of the bearing to be easily and accurately determined by applying a well-defined oil pressure in the hydraulic nut. The correct fit is then achieved by controlling the axial drive-up from this position.

The SKF drive-up method incorporates the use of a new type of hydraulic nut fitted with a dial indicator to control the drive-up and a specially calibrated pressure gauge, mounted on the selected pump (\rightarrow fig 8).

Fig 8

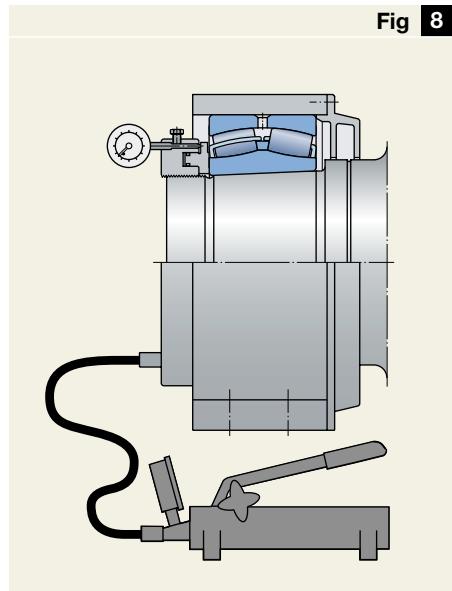

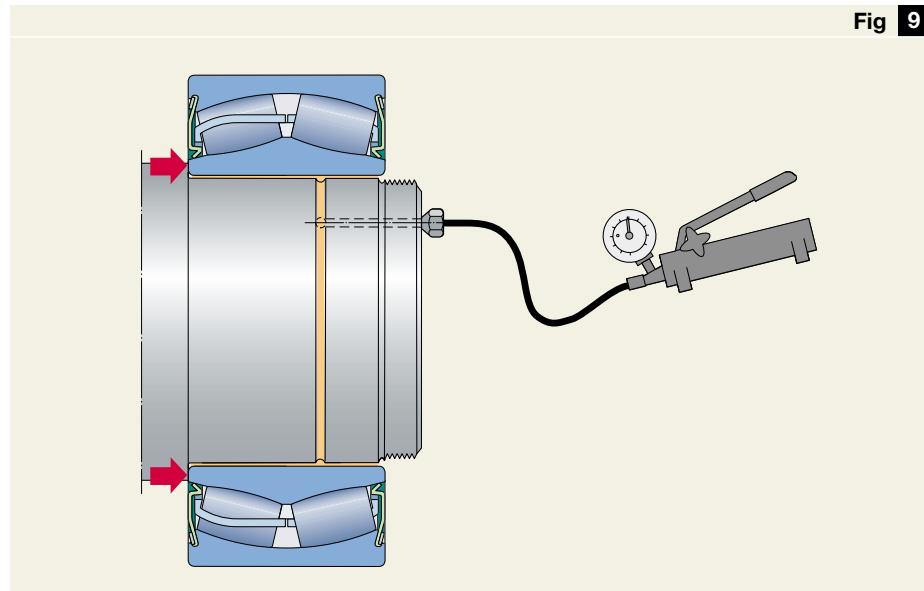

Fig 9

Dismounting

The force required to remove a bearing is generally greater than the mounting force, particularly if, after a long period of service, fretting corrosion is present. If bearings or other associated components are to be reused after inspection, they must be dismounted as carefully as they were mounted, and the dismounting force should never be applied through the rolling elements.

Bearings with cylindrical bore

Small bearings can generally be removed using a mechanical puller. These withdrawal tools should grip over the rings from the inside or outside and contact the side faces.

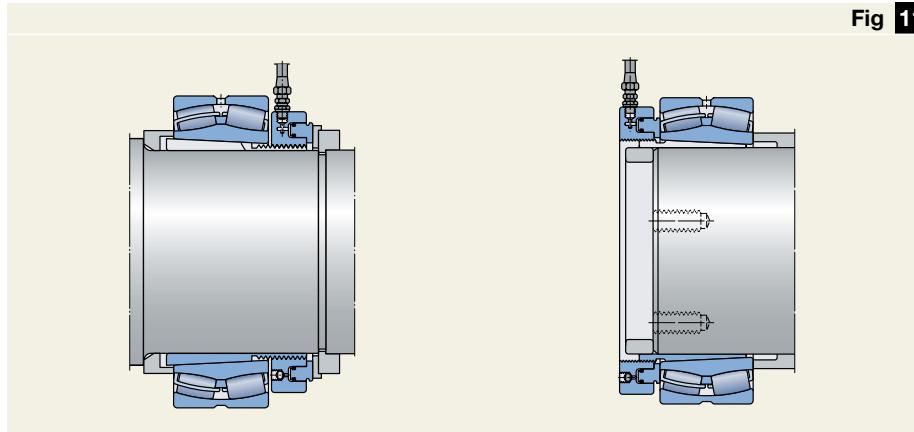

Dismounting larger bearings with bore diameters of 80 mm and above with an interference fit on the shaft is considerably eased, if the SKF oil injection method is used (→ fig 9).

Bearings with tapered bore

To remove spherical roller bearings from tapered journals, the oil injection method is recommended (→ fig 10). The film of pressurised oil separates the two mating surfaces and makes the bearing slide off easily.

Bearings mounted on adapter or withdrawal sleeves are most easily

Dismounting bearings on adapter and withdrawal sleeves with hydraulic nuts

Safety note

To avoid damage or accidents when dismounting bearings from tapered seatings using the oil injection method, always make sure that the bearing is blocked at the shaft end, e.g. by a lock nut, to prevent it from falling off.

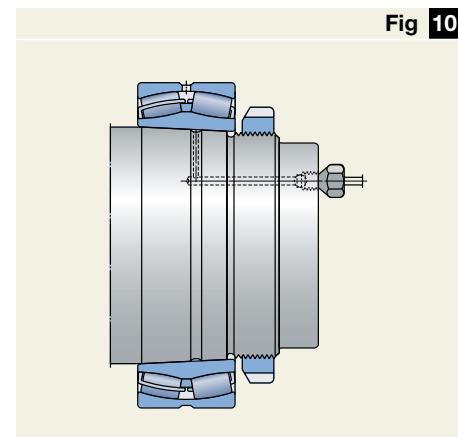

Fig 10

Dismounting a bearing from a tapered journal using the SKF oil injection method

removed using a hydraulic nut (→ fig 11). By using sleeves with oil ducts and oil distribution grooves, the oil injection method easily facilitates the removal of large bearings (→ fig 12).

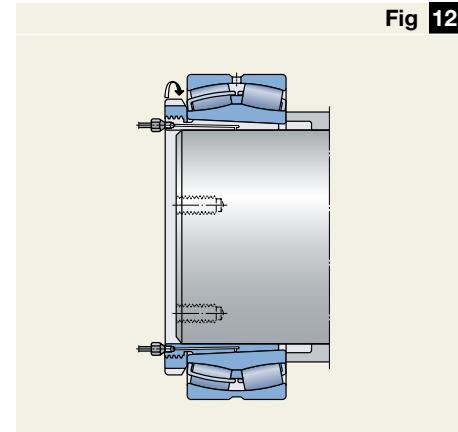

Fig 12

Lubrication and maintenance

Oil lubrication

For oil lubrication of spherical roller bearings, oil bath and circulating oil lubrication are the two main options.

Oil bath

This is the most simple method of oil lubrication (→ fig 1). The oil, which is picked up by the rotating components of the bearing, is distributed within the bearing and then flows back to the oil bath.

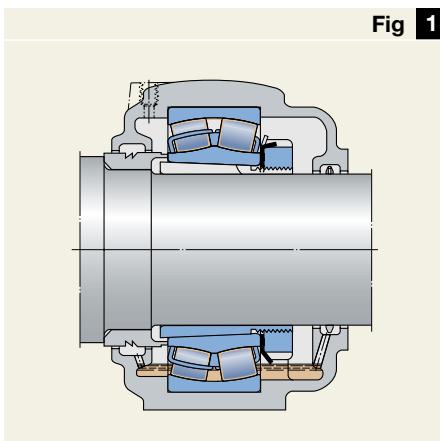

The oil level should be such that it almost reaches the centre of the lowest roller when the bearing is stationary. The speed ratings for oil lubrication given in the product tables apply to this method of lubrication. Even under optimum operating conditions, the oil must be changed at least once a year.

Circulating oil

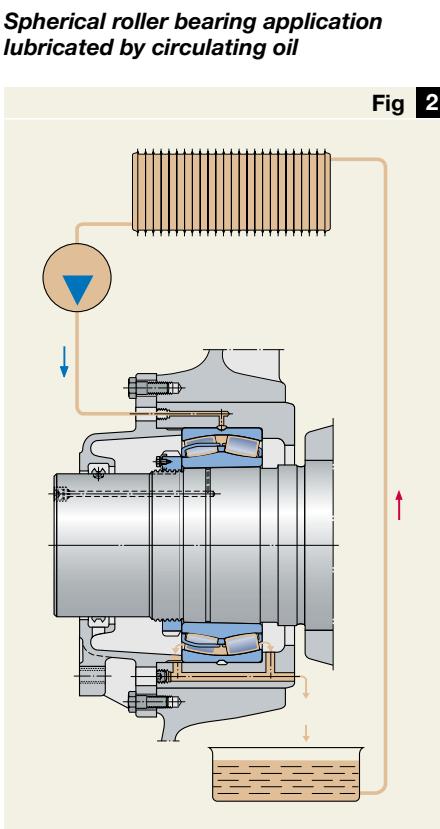

In the circulating system, the oil can be continuously filtered and/or cooled (→ fig 2). This significantly increases the service life of the oil, helping to avoid frequent oil changes.

The circulation can be produced by a pump. Adequately dimensioned ducts must allow the oil to leave the arrangement after passing through the bearing.

An intermediate form of oil lubrication is one where the oil is splashed up from the oil bath by other components, e.g. gears in a gearbox.

Spherical roller bearing application lubricated by oil bath

Spherical roller bearing application lubricated by circulating oil

Fig 1

Grease lubrication

Today's modern greases allow an increasing number of maintenance-free bearing applications which are lubricated for life. Here, the selection of sealed SKF spherical roller bearings is the optimum choice, both technically and economically. These bearings are filled with the SKF lithium base grease LGEP 2 before leaving the factory (→ Table 1) and are ready to mount and operate.

In cases where the operating conditions are so harsh that very frequent relubrication is needed or where sealed SKF spherical roller bearings are not available, SKF offers a full range of greases and tools to enable proper lubrication of the bearing (→ section "Lubricants and lubrication equipment" on page 60).

Relubrication

It is only possible to determine the time at which relubrication is required based on statistics. The definition used by SKF for the recommendations regarding relubrication intervals relates to a time at which 99 % of the bearings are still reliably lubricated, i.e. they correspond to an L₁ grease life which is the relubrication interval t_f. The L₁₀ grease life is approximately twice the L₁ life.

If the L₁₀ grease life corresponds to, or exceeds, the L₁₀ life of the bearing, the bearing may be considered as being lubricated for life, and relubrication will not be required.

The following recommendations are based on the results of long-term tests in various applications. They do not apply where water and/or particulate contaminants can penetrate the bearing arrangement. In such cases it is advisable to replenish or renew the grease fill in the arrangement more frequently to remove moisture or other contaminants.

1 Product information

Page 3

Relubrication intervals

Under normal conditions the relubrication interval t_f can be determined from **Diagram 1** based on

- the rotational speed n and
- the bearing bore diameter d .

The diagram is valid for bearings, which are lubricated with a quality lithium base grease, on horizontal shafts in stationary machines where loads are normal and the operating temperature does not exceed the "reference temperature" for the grease; this is usually 70 °C (158 °F).

Lubricating greases age with time and this process is accelerated at elevated temperatures. Therefore, the relubrication interval obtained from the diagram should be halved for every 15 °C (27 °F) above the reference temperature. At temperatures below 70 °C (158 °F), the relubrication interval may be extended.

Where bearings having bore diameters larger than some 300 mm are concerned, the high specific loads mean that adequate lubricant supply to the rolling contacts can only be secured if relubrication is more frequent than suggested by the diagram. For this reason the relevant curves are shown as dashed lines. In such cases continuous relubrication is recommended.

Lubrication

3 Product data

Page 32

Diagram 1

Example

A spherical roller bearing with a bore diameter (d) of 100 mm rotates at 1 000 r/min. The operating temperature varies between 60 and 70 °C (140 to 158 °F). What is the correct relubrication interval? Follow the line from 10^3 on the speed (x) axis to the intersection of the curve for $d = 100$ mm. Then follow a line from this intersection horizontally across to the value of t_f which is approximately 2 000. The relubrication interval is therefore 2 000 operating hours.

1 Product information

Page 3

Grease quantity for periodic relubrication

If the relubrication interval is less than 6 months, it is recommended to replenish the grease fill in the bearing arrangement at intervals corresponding to $0,5 t_f$. The complete grease fill should be replaced after three replenishments.

Suitable quantities to be added for open bearings can be obtained from

$$G_p = 0,005 D B$$

and for sealed bearings from

$$G_p = 0,0015 D B$$

where

G_p = grease quantity to be added when replenishing, g

D = bearing outside diameter, mm

B = total bearing width, mm

The bearing must rotate during relubrication to achieve proper distribution of the grease.

2 Recommendations

Relubrication

Grease quantity for continuous relubrication

The grease quantity to be continuously supplied can be obtained from

$$G_k = (0,3 \dots 0,5) D B \times 10^{-4}$$

where

G_k = grease quantity to be continuously supplied, g/h

D = bearing outside diameter, mm

B = total bearing width, mm

Continuous relubrication can be efficiently achieved using the SKF SYSTEM 24 lubricator.

3 Product data

Page 32

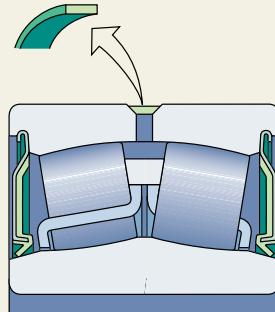

Relubrication of sealed SKF spherical roller bearings

The sealed spherical roller bearings shown in the product tables (page 54 onwards) have an annular groove and three lubrication holes as standard. To prevent moisture from penetrating and to retain the grease in the bearing a polymer band in the groove covers the lubrication holes (→ fig 3).

If it is anticipated that bearing relubrication will be necessary during operation, the band should be removed before the bearing is mounted. When relubricating, grease should be slowly pressed into the bearing as it rotates until fresh grease emerges from the sealing lips. Excess pressure should be avoided to prevent seal damage.

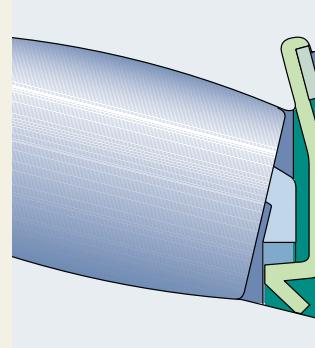

A polymer band in the annular groove covers the lubrication holes in the outer ring of sealed bearings

Page 3

Maintenance

The seals of SKF spherical roller bearings with a bore diameter of 110 mm and above are secured by retaining rings inserted in the outer ring (→ fig 4). The seals can be removed from the bearing so that the bearing can be inspected, washed and regreased, after which the seals can be reinserted and secured. To avoid damage to the seals, this work has to be done with care, using suitable, well rounded tools with no sharp edges.

1. Remove the retaining ring by inserting a tool under the recessed end of the retaining ring (→ fig 5) and pushing it out of the groove.
2. Remove the second retaining ring as above.
3. Swivel out the inner ring, so that the seals are pushed out by the rollers.
4. The bearing, seals and retaining rings can now be washed
5. Inspect the parts for further usability.
6. Regrease the bearing with inner ring swivelled out.
7. Align the bearing and put it on a clean surface for remounting the seals.
8. Insert the seal as far as possible into its groove in the outer ring. Hold down the already inserted part of the seal with one hand, and press in the remainder, stepwise with the thumb of the other hand (→ fig 6).

2 Recommendations

Maintenance

9. Mount the retaining ring by inserting the rectangular end first. Holding this part down, press in the remainder stepwise with a tool, until the whole retaining ring properly contacts the seal as shown in fig 4.
10. Mount the second seal according to steps 7 to 9.
11. If the bearing is not immediately re-used, preserve the bearing surfaces with oil and make sure that the bearing is well packed.

Designs

Depending on the size and the series, SKF spherical roller bearings incorporate one of the internal designs shown below. Common features of all designs include symmetrical rollers and a floating guide ring between the roller rows. The arrangement of the guide ring as well as the cage execution are different for the various designs.

E design
 $d \leq 65$ mm

Guide ring centred on the inner ring, two window-type steel cages.

E design
 $d > 65$ mm

Guide ring centred on the cages, two window-type steel cages.

C, CC, EC and ECC designs

Guide ring centred on the inner ring, two window-type steel cages.

CA, CAC, CAF, ECA and ECAF designs

Guide ring centred on the inner ring, retaining flanges on the inner ring, one-piece machined cage of brass or steel (suffix F).

CAFA and CAMA designs

Guide ring centred on the inner ring, retaining flanges on the inner ring, one-piece machined cage of steel (CAFA) or brass (CAMA).

Explorer

The designations of Explorer bearings are printed in blue in the product tables.

Cylindrical or tapered bore

SKF spherical roller bearings are available with cylindrical bore and tapered bore. The tapered bore of bearings of series 240, 241, 248 and 249 has a taper of 1:30, whereas the bore of the other bearing series have a taper of 1:12.

Annular groove and lubrication holes

Efficient lubrication of the SKF spherical roller bearings is facilitated by either

- three lubrication holes and an annular groove (E design or suffix W33) or
- three lubrication holes without annular groove (suffix W20).

Dimensions

The boundary dimensions of SKF spherical roller bearings with and without seals are in accordance with ISO 15:1998, except for the width of the

sealed bearings of series BS2-22.

These are basically series 222 E or 222 CC bearings, but are slightly wider to integrate the seals.

Tolerances

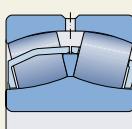

SKF spherical roller bearings with cylindrical and tapered bore are produced as standard with normal tolerances corresponding to ISO 492:1994.

Running accuracy

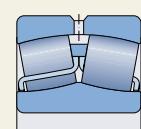

In high-speed bearing arrangements the demands on running accuracy are often higher than usual. For such bearing arrangements, the C08 execution is recommended which has running accuracy to ISO tolerance class 5 specifications. The values for the running accuracy are in accordance with ISO 492:1994. Check availability of the C08 specification bearing before ordering.

Internal clearance

SKF spherical roller bearings are manufactured as standard with Normal radial internal clearance. Nearly all the bearings are also available with a larger C3 internal clearance and some can be supplied with an even larger C4 clearance. Some sizes can be delivered with C2 internal clearance which is smaller than Normal. Check the availability of bearings with radial

Radial internal clearance of spherical roller bearings with tapered bore

1 Product information

Page 3

Misalignment

Spherical roller bearings can accommodate misalignment between the outer and inner rings without affecting the bearing. The guideline values of permissible misalignment given in **Table 3** refer to open bearings and are valid for normal loads ($C/P > 10$) and operating conditions, and when the inner ring rotates under constant misalignment.

Whether the stated values of misalignment between the outer ring and inner ring can be fully exploited or not depends on the design of the bearing arrangement, the type of seals used etc.

Under the same conditions, sealed SKF spherical roller bearings can accommodate angular misalignments of the shaft with respect to the housing of up to approximately $0,5^\circ$.

Influence of operating temperature on the bearing materials

SKF spherical roller bearings rings and rollers are special heat treated so that they can be used at temperatures up to $+200^\circ\text{C}$ (390°F) for up to 2 500 hours or for brief periods at even higher temperatures without any inadmissible dimensional changes occurring. If provision is made to accommodate slight changes of fits and clearance, even higher temperatures or longer periods can be accommodated.

Sealed SKF spherical roller bearings should not be used at operating temperatures above $+110^\circ\text{C}$ (230°F) as this would be detrimental to the seals and grease.

2 Recommendations

Page 18

Axial load carrying capacity

Because of their special internal design, SKF spherical roller bearings not only have lower friction than other spherical roller bearings, they are also able to accommodate appreciably heavier axial loads. However, if $F_a/F_r > e$ (\rightarrow **product tables**), a more frequent relubrication than usual is recommended.

Speed ratings

Due to the friction generated by contact seals, the speed ratings for sealed bearings for normal temperatures are approximately 40 % of those for the corresponding open bearings.

Supplementary designations

The designation suffixes used to identify certain features of SKF spherical roller bearings are explained below. The suffixes used to identify bearing (and cage) design, e.g. CC or E, are not included here as they are explained under "Designs".

C2 Radial internal clearance smaller than Normal

C3 Radial internal clearance greater than Normal

C4 Radial internal clearance greater than C3

C08 Increased running accuracy to ISO tolerance class 5

C083 C08 + C3

C084 C08 + C4

2CS Sheet steel reinforced rubbing seals of nitrile rubber (NBR) at both sides of bearing. Grease fill 25 to 35 % with SKF grease LGEP 2. Annular groove and three lubrication holes in outer ring.

2CSW 2CS + W

2CS2 Sheet steel reinforced rubbing seals of fluoro rubber (FPM) at both sides of bearing. Grease fill 70 to 100 % with a polyurea high temperature grease. Annular groove and three lubrication holes in the outer ring.

2CS2W 2CS2 + W

2CS5 Sheet steel reinforced rubbing seals of hydrogenated nitrile rubber (HNBR) at both sides of bearing. Grease fill 70 to 100 % with a polyurea high temperature grease. Annular groove and three lubrication holes in the outer ring.

2CS5W 2CS5 + W

Special spherical roller bearings

Their robust design and high reliability make SKF spherical roller bearings suitable for the majority of applications. However, extraordinary demands call for bearings with extraordinary features. Therefore, the SKF standard range includes special spherical roller bearings, which are adapted for specific applications:

Sealed bearings for continuous casting applications

These bearings are specially adapted for the high loads and operating temperatures and low speeds present in continuous casting slab guides. They feature seals made of fluoro rubber, and are filled with a very stable high temperature grease, allowing maintenance-free operation in this demanding environment.

Bearings for vibrating applications

Series 223 bearings with special clearance are modified to cope with shaft deflection encountered in vibrating applications. They are characterised by a hardened floating guide ring centred in the outer ring which guides the highly wear resistant, surface hardened window-type steel cages. To prevent fretting corrosion at the non-locating bearing position, a special version with PTFE-coated cylindrical bore is available.

Rolling mill bearings

Rolling mill bearings must meet a variety of different demands. For cold tube mills (Pilger mills), for example, the bearings must be able to withstand high acceleration forces, whereas for finishing trains or wire mills, they must be able to be mounted and dismounted with ease. SKF offers the appropriate spherical roller bearings for these applications.

SKF Pop Release units

These plummer block type mounted bearing units with series 222 Explorer bearing on a special adapter sleeve are greased, sealed and ready to install as delivered. With the saw-tooth profile of the inner ring and adapter sleeve, the unit can be mounted and dismounted easily via the incorporated screws without having to use special tools.

See also SKF brochures 4954 "The SKF Copperhead system solution for vibrating screens" and 5103 "Pop Release bearing units for speedier mounting".

Accessories

Any system is only as strong as its weakest member. Therefore, SKF offers not only a wide range of excellent spherical roller bearings, but also an appropriate range of quality bearing accessories to go with them.

Bearing housings

SKF offers a comprehensive range of high-quality standard and custom housings designed to accommodate the various demands placed on the bearings which they house, e.g. load, accuracy, type of lubrication and lubricant, sealing, etc.

Along with the appropriate SKF spherical roller bearings, these SKF housings comprise an economic and interchangeable unit which meets all the performance demands of a bearing application.

See also SKF catalogue 3766 "Bearing accessories" and SKF brochures 4403 "SNL plummer block housings solve the housing problems" and 5101 "SNL 30 and SNL 31 plummer block housings solve the housing problems".

Adapter and withdrawal sleeves

Adapter and withdrawal sleeves are used to locate bearings with tapered bore on smooth or stepped shafts. They facilitate bearing mounting and dismounting and, in many cases, simplify bearing arrangement design. Several series of quality sleeves are included in the SKF product range.

Lock nuts

SKF lock nuts, also referred to as shaft nuts, are available in several designs to axially locate bearings on shaft ends. The most popular are those of series KM, KML and HM. These nuts have four or eight equally spaced slots in the outside diameter and are locked in position with locking washers or locking clips engaging a groove in the shaft. The nut dimensions are in accordance with ISO 2982-2:1995 as are the dimensions of the series MB and MBL locking washers.

Other lock nuts produced by SKF include series KMT, KMTA, KMK and KMFE, that do not require a groove in the shaft.

Lubricants and lubrication equipment

Spherical roller bearings operate under the most varying load, speed, temperature and environmental conditions. They require the type of high-quality lubricating greases, which SKF provides.

SKF greases have been specially developed for rolling bearings in their typical applications. The SKF range includes fifteen environmentally friendly greases and covers practically all application requirements.

The range is complemented by a selection of lubrication accessories including

- automatic lubricators,
- grease guns,
- lubricant metering devices and
- a wide range of manually and pneumatically operated grease pumps.

Products for mounting and dismounting

Like all rolling bearings, SKF spherical roller bearings require a high degree of skill when mounting or dismounting, as well as the correct tools and methods.

The comprehensive SKF range of tools and equipment includes everything that is required:

- mechanical tools,
- heaters,
- hydraulic tools and equipment,
- pullers and withdrawal tools for all sizes of bearings.

Induction heater, hydraulic pumps, hydraulic nut, mounting fluid and anti-fretting paste from SKF

Condition monitoring equipment

The goal of condition monitoring is to maximise the time that the machine is functioning well and minimise the number of breakdowns, thereby significantly reducing operating downtime and maintenance costs.

To achieve this, it is recommended that the bearing and machine condition be monitored either periodically or continuously. Condition monitoring enables incipient bearing damage to be detected and evaluated, so that bearing replacement can be scheduled for a time when the machine is not in operation, to avoid unplanned stoppages. Applied to all machinery (not just sensitive or problematic machines), condition monitoring improves machinery operation to an optimum level, often exceeding the original equipment specifications.

SKF provides a comprehensive range of condition monitoring equipment to measure all important parameters. These include

- temperature,
- speed,
- noise,
- oil condition,
- shaft alignment,
- vibration and
- bearing condition.

The range includes lightweight, hand-held devices for manual use as well as complex continuous monitoring systems for fixed installations in connection with preventive maintenance.

One example is the Machine Reliability Inspection System MARLIN™ which is at the leading edge of technology and allows storage of up to 2 000 measuring points. It can be used to diagnose machines and individual bearings and is backed by tailored software for the evaluation of the readings including enveloping vibration acceleration curves.

The SKF Group – a worldwide corporation

SKF is an international industrial Group operating in some 130 countries and is world leader in bearings.

The company was founded in 1907 following the invention of the self-aligning ball bearing by Sven Wingquist and, after only a few years, SKF began to expand all over the world.

Today, SKF has some 40 000 employees and around 80 manufacturing facilities spread throughout the world. An international sales network includes a large number of sales companies and some 7 000 distributors and retailers. Worldwide availability of SKF products is supported by a comprehensive technical advisory service.

The key to success has been a consistent emphasis on maintaining the highest quality of its products and services. Continuous investment in research and

development has also played a vital role, resulting in many examples of epoch-making innovations.

The business of the Group consists of bearings, seals, special steel and a comprehensive range of other high-tech industrial components. The experience gained in these various fields provides SKF with the essential knowledge and expertise required in order to provide the customers with the most advanced engineering products and efficient service.

The SKF Group is the first major bearing manufacturer to have been granted approval according to ISO 14001, the international standard for environmental management systems. The certificate is the most comprehensive of its kind and covers more than 60 SKF production units in 17 countries.

The SKF Engineering & Research Centre is situated just outside Utrecht in The Netherlands. In an area of 17 000 square metres (185 000 sq.ft) some 150 scientists, engineers and support staff are engaged in the further improvement of bearing performance. They are developing technologies aimed at achieving better materials, better designs, better lubricants and better seals – together leading to an even better understanding of the operation of a bearing in its application. This is also where the SKF Life Theory was evolved, enabling the design of bearings which are even more compact and offer even longer operational life.

SKF has developed the Channel concept in factories all over the world. This drastically reduces the lead time from raw material to end product as well as work in progress and finished goods in stock. The concept enables faster and smoother information flow, eliminates bottlenecks and bypasses unnecessary steps in production. The Channel team members have the knowledge and commitment needed to share the responsibility for fulfilling objectives in areas such as quality, delivery time, production flow etc.

SKF manufactures ball bearings, roller bearings and plain bearings. The smallest are just a few millimetres (a fraction of an inch) in diameter, the largest several metres. SKF also manufactures bearing and oil seals which prevent dirt from entering and lubricant from leaking out. SKF's subsidiaries CR and RFT S.p.A. are among the world's largest producers of seals.
